

# TCM Plus enhancement series

## Multi-Company / Multi-Location Management

### What it does

If you have multiple plants, companies or locations, this enhancement can simplify your ability to plan, move and track inventory and production between those entities. With this series of custom TCM enhancements, you can gain greater visibility, improve accuracy, and significantly reduce or eliminate the manual entry needed to manage a multi-location and/or multi-company environment.

### You need this enhancement if...

- You move inventory between plants, locations or TCM companies.
- You need to plan and track inventory in-transit.
- The volume of inventory transfers requires much manual effort — and is therefore error prone.

### Features Available

This is a partial list of the field-proven features available from Dash. Your business environment may be suited for some, or all of these:

- Eliminate manual inventory transactions for transfers between companies and locations.
- Track inter-company and/or inter-location supply, demand and in-transit inventory with automated and synchronized Purchase and Customer orders.
- Make planning systems, such as Reorder Point and MRP aware of multi-company and/or location transfers (including transit lead times).
- Automate transfers through the use of synchronized Purchase Orders (for supply requests) and Customer Orders (for demand).
  - Optionally track transfer quantities separately from Month/Year-to-date usage and sales summaries in Inventory.
- Product Definition — the following become location / company sensitive:
  - Inventory — With one part, identify it as manufactured in one location, and purchased in a different location.
  - Bills-of-Materials — identify location-sensitive components, where it may be used in only one location.
  - Routings — location-sensitive routings. Valuable when processes differ at different locations.
- Synchronize due dates (on the supplying company/location) and expected delivery dates (on the receiving location/company) – including transit time in lead time calculations.
